

ABSTRACT

5 An information processing system contains an
arrangement for enabling printing on demand of position-
coded bases. In the arrangement, a current graphical
object is selected from a set of graphical objects
prestored in the system, which each define graphic
information and corresponds to a rule object which
10 connects at least one processing measure to the graphic
information. In the arrangement, the current graphical
object is assigned position data from a position data
bank. The assigned position data can then be applied,
together with the graphic information, to a substrate for
15 forming the position-coded base. The arrangement also
provides allocation data in the system, which associates
the assigned position data with the graphical object in
such a manner that position data read from the base by
means of a digital pen device can be processed in the
20 system using the adequate rule object.
